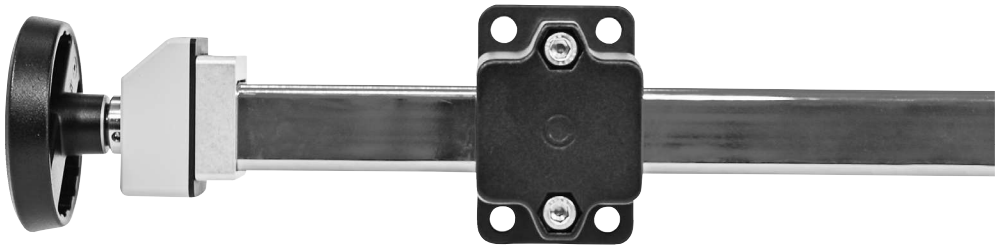
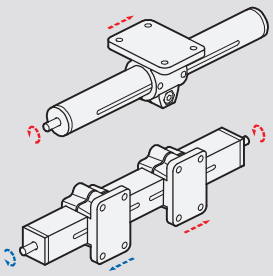
Highlights

Configurable Linear Actuators



Standard Parts. Ganter.

Configure your linear actuator: Four steps to the right product

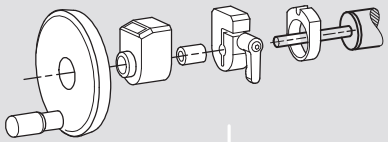


1

Select the linear actuator

Round or square, one or two spindles, independent or opposing: The type overview on page 2 can assist you in selecting the right linear actuator.

GN 2910 / GN 2911 /
GN 2920 / GN 2921 /
GN 2930 / GN 2931



2

Choose accessories

The stud lengths on the linear actuator vary depending on the chosen accessories. The type overview on page 25 details the range of possible accessories.

3

Ordering the linear actuator

The linear actuator can now be ordered customized for the chosen accessories.

How to order

Configurable Linear Actuators

Introduction / Overview of Types

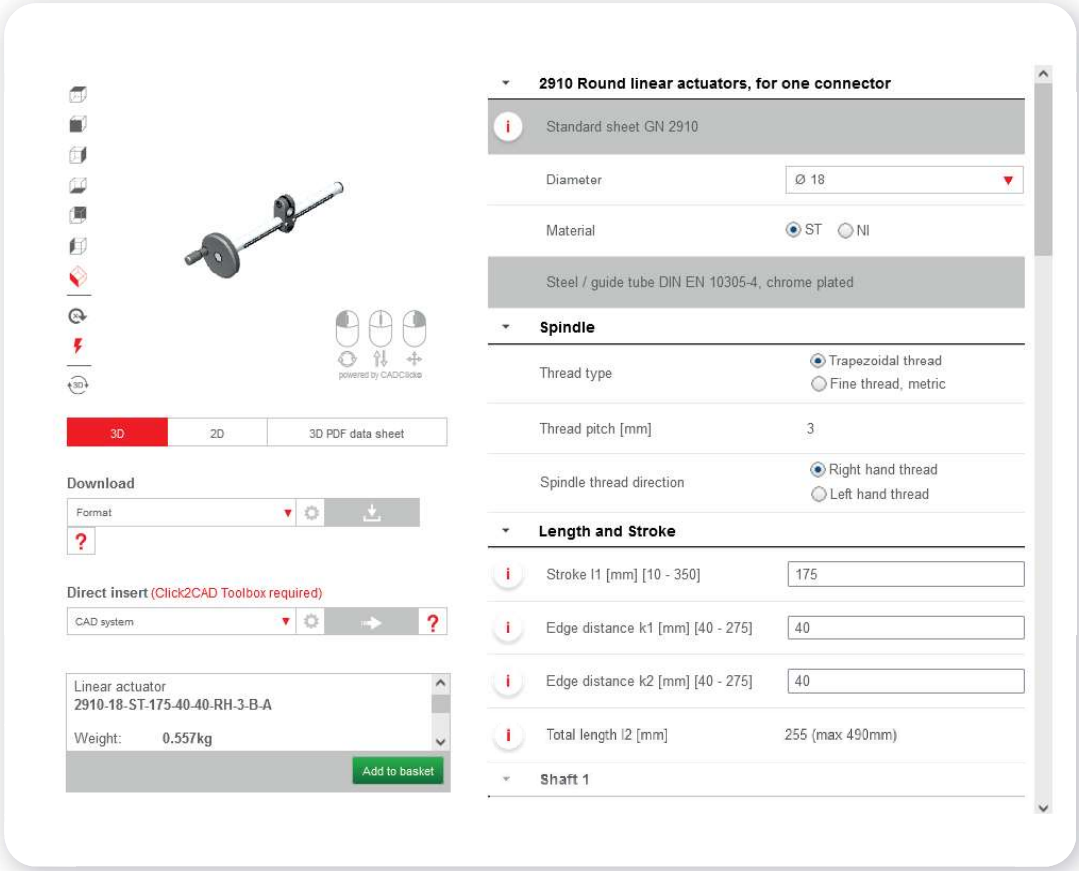
Configurable linear actuators move parts along their horizontal axis. The installed linear actuator connector is moved linearly by the pitch of the drive spindle inside the guide tube. A variety of kinematic designs are available to flexibly cover a wide range of applications. Linear actuators are used anywhere that linear movements are required, such as in machine and plant construction and for format adjustment.

The lengths and strokes of the linear actuators can be freely selected. They can be ordered specifically using the supplemental section of the article number (see order example on each standard sheet). The spindles are available in right and left versions as well as with different pitches. The stud of the threaded spindle, which is used to drive the linear actuator, varies in length depending on the required accessories.

The guide tubes of the configurable linear actuators are made of precision tubes of chrome plated steel or stainless steel with a plain finish. They are combined with the linear actuator connector to create either round or square linear guides.

Combining the fully configured linear actuator with a linear actuator connector results in a complete functional unit.

Part no.	Number of required linear actuator connectors	Kinematics	Function	Dimension Guide tube d_1	Dimension Guide tube s
GN 2910 Page 4 	1		The installed linear actuator connector is moved linearly along the guide tube by the pitch of the spindle thread.	18 30 40 50 60	-
GN 2911 Page 7 	1			-	30 40 50
GN 2920 Page 10 	2		The two linear actuator connectors move symmetrically along the guide tube due to the different thread directions.	18 30 40 50 60	-
GN 2921 Page 13 	2			-	30 40 50
GN 2930 Page 16 	2		The linear actuator connectors move along the guide tube independently of the opposite side due to separate spindles.	30 40 50 60	-
GN 2931 Page 19 	2			-	30 40 50



Simple online configuration and ordering at ganternorm.com

The new online configurator makes configuring your individual linear actuator incredibly easy while providing a complete overview of the various designs and possible accessories. When finished, you can even place an order directly from the configurator.

Information

The guide tubes of the linear actuators GN 2910 are made of precision tubes of chrome plated steel or stainless steel with a plain finish. A continuous spindle with ball bearings at both ends is installed within the guide tube. The guide nut transmits the linear movements to a linear actuator connector along the guide groove via a follower.

A solid linear round guide is created by connecting the guide tube with the hole of the linear actuator connector. Multiple connector types are available and can be adjusted or clamped with low backlash thanks to the slotted holes. Depending on the setup, either the part to be moved is fastened to the connector or the connector itself is installed at the application site such that the entire linear actuator moves.

The overview offers a range of possible accessories that can be installed on the linear actuator in the various configurations. The design and length of the stud varies depending on the accessories, and this must be considered when selecting the linear actuator. The accessories are not included with the linear actuators and must be ordered separately. For assistance, please consult the overview of types on *page 25*.

A linear actuator connector is also needed to build a functioning linear actuator. A wide range of different versions are available to meet the needs of the specific application. The overview of types on *page 32* can assist in making a selection.

Information

The guide tubes of the linear actuators GN 2911 are made of square tubes of chrome plated steel or stainless steel with a plain finish. A continuous spindle with ball bearings at both ends is installed within the guide tube. The guide nut transmits the linear movements to a linear actuator connector along the guide groove via a follower.

A solid linear square guide is created by connecting the guide tube with the hole of the linear actuator connector. The square shape is particularly suited for receiving torsional forces. Multiple connector types are available and can be adjusted or clamped with low backlash thanks to the split design of the holes. Depending on the setup, either the part to be moved is fastened to the connector or the connector itself is installed at the application site such that the entire linear actuator moves.

The overview offers a range of possible accessories that can be installed on the linear actuator in the various configurations. The design and length of the stud varies depending on the accessories, and this must be considered when selecting the linear actuator. The accessories are not included with the linear actuators and must be ordered separately. For assistance, please consult the overview of types on *page 25*.

A linear actuator connector is also needed to build a functioning linear actuator. A wide range of different versions are available to meet the needs of the specific application. The overview of types on *page 32* can assist in making a selection.

Information

The guide tubes of the linear actuators GN 2930 are made of precision tubes of chrome plated steel or stainless steel with a plain finish. Two independent spindles with ball bearings at both ends are installed within the guide tube. The thread direction of the spindles can be chosen independently for each side. The guide nuts on each of the spindles transmit the linear movements to the linear actuator connector along the guide groove via a follower, independently of the opposite side.

A solid linear round guide is created by connecting the guide tube with the holes of the linear actuator connectors. Multiple connector types are available and can be adjusted or clamped with low backlash thanks to the slotted holes. Depending on the setup, either the part to be moved is fastened to the connector or the connector itself is installed at the application site such that the entire linear actuator moves.

The overview offers a range of possible accessories that can be installed on the linear actuator in the various configurations. The design and length of the stud varies depending on the accessories, and this must be considered when selecting the linear actuator. The accessories are not included with the linear actuators and must be ordered separately. For assistance, please consult the overview of types on *page 25*.

Linear actuator connectors are also needed to build a functioning linear actuator. A wide range of different versions are available to meet the needs of the specific application. The overview of types on *page 32* can assist in making a selection.

Hinweis

The guide tubes of the linear actuators GN 2931 are made of square tubes of chrome plated steel or stainless steel with a plain finish. Two independent spindles with ball bearings at both ends are installed within the guide tube. The thread direction of the spindles can be chosen independently for each side. The guide nuts on each of the spindles transmit the linear movements to the linear actuator connector along the guide groove via a follower, independently of the opposite side.

A solid linear square guide is created by connecting the guide tube with the holes of the linear actuator connectors. The square shape is particularly suited for receiving torsional forces. Multiple connector types are available and can be adjusted or clamped with low backlash thanks to the split design of the holes. Depending on the setup, either the part to be moved is fastened to the connector or the connector itself is installed at the application site such that the entire linear actuator moves.

The overview offers a range of possible accessories that can be installed on the linear actuator in the various configurations. The design and length of the stud varies depending on the accessories, and this must be considered when selecting the linear actuator. The accessories are not included with the linear actuators and must be ordered separately. For assistance, please consult the overview of types on *page 25*.

Linear actuator connectors are also needed to build a functioning linear actuator. A wide range of different versions are available to meet the needs of the specific application. The overview of types on page 32 can assist in making a selection.

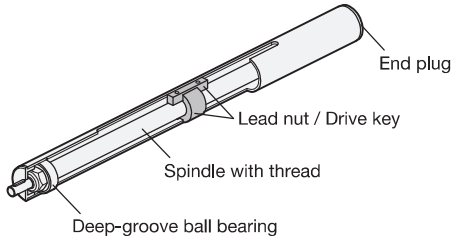
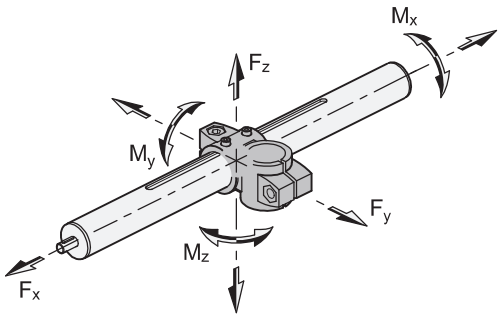
Technical Description

The linear actuators have a guide nut that is moved axially by means of the threaded spindle with ball bearings. The follower prevents twisting and forms the connection to the installed linear actuator connector.
Tube clamps are available in a wide variety of different designs for fastening the linear actuators.



Load Data



Ø Linear actuator	**Fx** in N	**Fy** in N			**Fz** in N			**Mx** in Nm	**My** in Nm	**Mz** in Nm

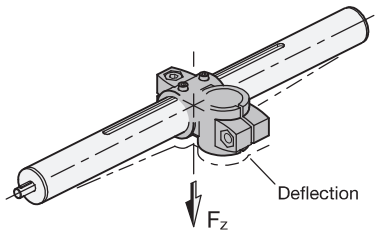
50	1750	3100	650	150	3100	650	150	29	69	69
60	2600	4550	1500	400	4550	1400	350	45	125	125

Deflection / Elastic Deformation

The maximum permissible forces and torques given in the table result in elastic deformation of the linear actuator. With the values listed, this amounts to approximately 0.4 mm. The figure shows this deformation using force F_z as example.



Positioning precision

The positioning precision indicates the amount of deviation with which a specific position can be reached. The table indicates the maximum occurring deviation.

Max. deviation	
Trapezoidal thread drive	Find thread drive
± 0.1 mm / 300 mm Hub	± 0.1 mm / 300 mm Hub

Repeatability

The repeatability indicates how precisely a position can be reached multiple times under identical conditions. In general, the repeatability is higher than the positioning precision because manufacturing tolerances have no influence on the repeatability. With the trapezoidal and fine thread drives used, the repeatability is ±0.05 mm.

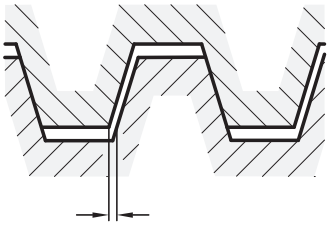
Guidance Accuracy

The precision guide tubes of the linear actuators are made of steel as per DIN EN 10305-4 and are also chrome plated. The stainless steel design makes use of stainless steel precision tubes as per EN 10216-5.

Backlash on Reversal

The play between the thread flanks of the spindle and the spindle nut results in idling when the drive direction is changed. Before the connector moves in the opposite direction, this play must first be overcome.

This backlash on reversal prevents the spindle nut and spindle from jamming up. For linear actuators with trapezoidal and fine thread spindles, the backlash on reversal is 0.2 mm.



Self-Braking

Because the pitch angle of trapezoidal and fine thread spindles is smaller than the angle of friction, these spindles are self-braking. It is not possible to push the linear actuator connector. The spindle can also be additionally secured with an external spindle lock by means of clamping plates.

Lifespan

The lifespan of linear actuators in a given application depends on the expected environmental conditions.

The following factors come into play:

- Installation position
- Load moved
- Movement speed
- Movement frequency
- Ambient temperature
- Compliance with maintenance intervals

Environmental Conditions

The linear actuators are designed for ambient temperatures from -20 °C to +100 °C. In general, large temperature fluctuations and condensing humidity should be avoided.

Accessories for Configurable Linear Actuators

Overview of Types

The accessories include parts that supplement the linear actuators or improve their usability. For example, handwheels can be used for operating the linear actuators, position indicators for monitoring the position and clamping plates for locking the spindle in place. The torque supports provide protection against twisting when installing a position indicator and clamping plate. The matching accessories can be selected on the various standard sheets based on the diameter of the chosen linear actuator.

Information

Handwheels GN 9234 are intended for use with linear actuators and are designed as disk or spoked handwheels, depending on their size.

The applied torque is transmitted by means of a parallel key, and the handwheel is secured axially with the supplied grub screw. The handwheels can be ordered without handles, with revolving handles or with revolving retractable handles.

Information

Clamping plates GN 9734 are used to fix the spindles of configurable linear actuators in place after adjustment.

Using a hand lever, the bore diamter of the clamping plate is reduced until the spindle stem of the linear actuator is clamped, preventing unintentional adjustment of the approached position.

The enclosed spiral pin connects the clamping plate to the torque support, preventing it from twisting. If no position indicator is mounted to the linear actuator, as shown in the example, type A is recommended.

Information

Position indicators GN 9534 are designed for attachment to configurable linear actuators. They are mounted to the spindle stem of the linear actuator using an adapter bushing and a grub screw. The directly driven counter with digital position display must be matched to the pitch of the threaded spindle.

The housing is welded by ultrasound, making it particularly sturdy, tight and compact. The foam rubber seal prevents the transmission of vibration to the counter and acts as a seal.
