

DEM - Demagnetiser

Our DEM demagnetiser is a high performance, hand held electric demagnetiser.

It is a quick & easy way to demagnetise metallic parts such as moulds & punches, which have become magnetised through working.

This is a common occurrence during processes such as drilling and grinding, and the unwanted result of this is the collection of metal dusts and swarfs which then cause dents & halos to machined products.

The demagnetiser is simply wiped over the part, and is ideal for most engineering purposes.

Specification

Width 76mm

Length 95mm

Height 107mm

Absorption W100 V230 Hz50
